Sealing large diameter pipes through concrete wall openings require specialized modular seal links contact us for WA-GKD units with 316L hardware.

Large pipes require a secure high grip force waterproof seal

Use modular seal links for large pipes that insure a watertight penetration through the wall

All American and International size steel, PVC, ductile iron or concrete pipes sealed with WA-GKD modular seals insure a class one no leak solution for large pipes. The seals are 72 psi seals that provide up to 160ft head pressure protection. Large pipes up to 120 inch diameter are accommodated.

Standard 316 stainless steel bolts and nuts offer long life corrosion free protection. High quality EDPM or NBR elastomer is the sealing elements.

Unique to WA-GKD large pipe modular seals, is the bolt head torque annunciators. The bolt head changes color when optimum torque on each bolt is attained. This informs the installer that optimum compression is achieved. No under tightened links.

Also a unique and efficient feature of our large pipe seal is the nuts are enclosed in the compression plates. This insures nuts are not loose and lost during the install phase.
