

## Leaking Link Seals repair solutions

When a link seal is leaking around a pipe, Westatlantic provides a solution to stop the leak problems. Leak stopping repairs may be made without taking the pipe out of service.

Westatlantic is a leading supplier of pipe sealing systems dedicated to concrete foundation and masonry wall leak proofing for pipe penetrations.

For leaking link seal problems use a WA-GP-T or a WA-GP-B external wall mount assembly. Both these systems are compression seal systems for watertight solutions to 36 psi conditions.

Using mastic or other paste products will not solve the problem.

Leave the link seal in place and reseal the pipe penetration from outside the wall with our external seal system.

Re-sealing may be accomplished without excavating around the foundation wall or manhole. Both the WA-GP-T and the WA-GP-B have low profiles and need little space to mount.

Sealing may take place on the inside wall or the outside wall.

If the inside manhole wall or inside foundation wall space is not available, the seal can mount on the outside wall.

Sealing pipes through concrete structures below grade requires well planned solutions and the selection of products that best fits the application.

All material for a ready install is shipped with the product.
