

WA-Modular seals for large diameter pipes

Pipe and conduit penetrations through walls require mechanical watertight seals.

Westatlantic pipe seals provide a better seal for below grade watertight solutions.

Installing straight wall sleeves without puddle flanges and seals are not satisfactory.

Westatlantic Tech Corp., supply pipe penetration new technology solutions.

WA modular seals show a color change window at the bolt head when optimum tightness is achieved during installation.

The modular seals are most effective when sealing large pipe diameters.

Depending upon the skill or care of the installer most link seal types may not be tightened to optimum torque. Leakage may occur when modular links are not tightened to optimum tightness.

WA-modular seals new generation modular seals prevent under torque installations. The installer tightens the bolt head until a color change is observed on each link bolt.

On inspection a supervisor or engineer can immediately observe that the required link tightness has been applied, the optimum yellow window confirms the link is watertight.

Westatlantic can also supply pipe seals to accommodate sealing for a pipe that is off center or eccentric even to the point where a pipe is laying against the wall opening.

Multi pipes through the same open are also available.
